

11/2017 博士班資格考：機率與統計 Show All Details

1. The number of events arrive in the interval (t_1, t_2) is modelled by a Poisson RV as follows, with $t = t_2 - t_1$. The corresponding stochastic process $x(t)$ is formed by the second formula. (30%)

$$P\{n(t_1, t_2) = k\} = \frac{e^{-\lambda t} (\lambda t)^k}{k!}$$

$$x(t) = n(0, t)$$

- Find the expectation of the stochastic process $x(t)$.
 - Find the autocorrelation $R_{xx}(t_1, t_2)$ for $t_2 > t_1$.
 - Draw a possible illustration to depict $x(t)$.
2. From Problem 1, a stochastic process $z(t)$ is used to describe the arrival time of each event of the process $x(t)$. (20%)
- If the stochastic process is of WSS, find the autocorrelation $R_{xx}(t_0, t_0 + \tau)$.
 - Find the expectation and autocorrelation of $z(t)$. Hint: $z(t)$ can be derived from the differentiation of $x(t)$.
 - Draw a possible illustration to depict $z(t)$.

3. Consider the R.V. with the density function as (20%)

$$f(x) = \begin{cases} \frac{1}{\beta} e^{-x/\beta} & x \geq 0 \\ 0 & \text{otherwise} \end{cases}$$

Suppose that independent observations, x_1, \dots, x_n , are taken from the distribution,

a. Give the likelihood function.

b. Find the MLE for the parameter, β .

4. A random sample of 30 students obtained a mean of 82 and a variance of 8 on a college placement test in math. Assume the scores to be normally distributed, construct the 98% confidence interval for the variance. (15%)

5. Let X and Y be two random variables with uniform distribution in the interval [0,1]. Let $Z=2X+3Y$. Find the probability distribution of Z. (15%)
